CONGRUENCE OF TRIANGLES

1. S S S (Side Side Side) congruence : If under a given correspondence two triangles are congruent if the three sides of one triangle are equal to the three corresponding sides of another triangle, then the triangles are congruent.

Note: The order of the letters in the names of congruent triangles displays the corresponding relationships. Thus when $\Delta ABC \cong \Delta RPQ$

A lies on R

B lies on P

C lies on Q

\overline{AB} along \overline{RP}

\overline{BC} along \overline{PQ}

And \overline{AC} along \overline{RQ}

2. S A S (Side - Angle -Side) Congruence

If under a correspondence, two sides and the angle included between them of a triangle are equal to two corresponding sides and the angle included between them of another triangle, then the triangles are congruent.

Q1. ABC and DBC are two triangles drawn on a common base BC such that AB = DC and

DB=AC on the same side of BC. Are ΔADB and ΔDAC congruent?

If yes, state the corresponding parts. Which conditions did you use to establish the congruence?

Solution: In $\triangle ADB$ and $\triangle DAC$ we have

$$AB = DC \text{ (given)}$$

$$BD = CA \text{ (given)}$$

$$AD = AD \text{ (common side)}$$

$$\triangle ADB \cong \triangle DAC \text{ Also, } A \leftrightarrow D, D \leftrightarrow A \text{ and } B \leftrightarrow C$$

Since the three corresponding equal parts are the sides of the triangle, therefore SSS congruence condition is used to prove the congruence.

Q 2. Check whether the following triangles are congruent by SAS congruence criteria?

Solution : Here we can see

$$AB = QR = 4 \text{ cm}$$

$$BC = PR = 6 \text{ cm.}$$

$$\angle B = 30^\circ, \angle P = 30^\circ$$

But $\angle P$ is not the included angle of side PQ and QR .

Therefore $\triangle ABC$ is not congruent to $\triangle PQR$.
