

Chapter - 14 STATISTICS

HANDOUT (Module 3 of 4)

Median of Group Data

Median

The median is the middle value of a distribution *i.e.*, median of a distribution is the value of the observation which divides it into two equal parts.

• **Median of ungrouped data:**

(i) Arrange the data in ascending order.

(ii) If n (number of observations) is odd, then median = $\left(\frac{n+1}{2}\right)^{\text{th}}$ observation.

(iii) If n (number of observations) is even, then median = $\frac{1}{2} \left[\left(\frac{n}{2}\right)^{\text{th}} \text{ observation} + \left(\frac{n}{2} + 1\right)^{\text{th}} \text{ observation} \right]$

• **Median of grouped data:** Median of a grouped data or continuous frequency distribution can be found by using the formula:

$$\text{Median} = l + \left(\frac{\frac{n}{2} - cf}{f} \right) \times h$$

where l = lower limit of the median class
 n = number of observations
 f = frequency of the median class
 h = size of the median class (assuming all class sizes to be equal)

Ex-1 The distribution below given the marks of 30 students of a class in mathematics. Find the median marks of the students

| Marks | 40-45 | 45-50 | 50-55 | 55-60 | 60-65 | 65-70 | 70-75 |
|---------------|-------|-------|-------|-------|-------|-------|-------|
| No of Student | 2 | 3 | 8 | 6 | 6 | 3 | 2 |

Solution.

| Marks | Number of students (f_i) | Cumulative frequency (cf) |
|--------------|------------------------------|-------------------------------|
| 40–45 | 2 | 2 |
| 45–50 | 3 | 5 |
| 50–55 | 8 | 13 |
| 55–60 | 6 | 19 → median class |
| 60–65 | 6 | 25 |
| 65–70 | 3 | 28 |
| 70–75 | 2 | 30 |
| Total | $\Sigma f_i = 30$ | |

$\Sigma f_i = n = 30, \frac{n}{2} = 15$
 Since cf just greater than $\frac{n}{2} = 15$ is 19.
 \therefore The corresponding class is 55–60 which is the median class.
 $n = 30, l = 55, cf = 13, f = 6, h = 5$

Ex-2 In a unit test, the marks obtained by 100 students (out of 50) are given below

| | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|
| Marks Obtain | 20 | 29 | 28 | 33 | 42 | 38 | 43 | 25 |
| No of student | 6 | 28 | 24 | 15 | 2 | 4 | 1 | 20 |

Solution. Arrange the variates (marks obtained) in ascending order and construct a cumulative frequency table as under:

| | | | | | | |
|----------------------|----|----|----|----|----|----|
| Marks obtained | 20 | 25 | 28 | 29 | 33 | 38 |
| No. of students | 6 | 20 | 24 | 28 | 15 | 4 |
| Cumulative frequency | 6 | 26 | 50 | 78 | 93 | 97 |

Total no. of observations = $n = 100$, which is even.

$$\text{So, the median} = \frac{\frac{n}{2}\text{th observation} + \left(\frac{n}{2} + 1\right)\text{th observation}}{2}$$

50th observation + 51th observation = 28 + 29

Ex-3 If the median of the distribution given below is 28.5 find the value of x and y

| Class interval | 0-10 | 10-20 | 20-30 | 30-40 | 40-50 | 50-60 | total |
|----------------|------|-------|-------|-------|-------|-------|-------|
| frequency | 5 | x | 20 | 15 | y | 5 | 60 |

Solution. Here, median = 28.5, $n = 60$

| Class interval | Frequency (f_i) | Cumulative freq |
|----------------|---------------------|-----------------|
| 0-10 | 5 | 5 |
| 10-20 | x | $5 + x$ |
| 20-30 | 20 | $25 + x$ |
| 30-40 | 15 | $40 + x$ |
| 40-50 | y | $40 + x + y$ |
| 50-60 | 5 | $45 + x + y$ |
| Total | $\Sigma f_i = 60$ | |

∴ Median class is 20-30

$$\begin{aligned} \therefore \text{Median} &= l + \left(\frac{\frac{n}{2} - cf}{f} \right) \times h \Rightarrow 28.5 = 20 + \left(\frac{30 - (5 + x)}{20} \right) \times 10 \\ \Rightarrow 28.5 &= 20 + \frac{25 - x}{20} \times 10 \Rightarrow 28.5 = 20 + \frac{25 - x}{2} \Rightarrow \end{aligned}$$
