### CHAPTER 7 CONGRUENCE OF TRIANGLES

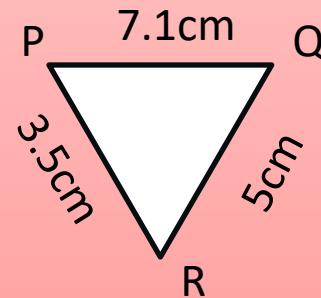

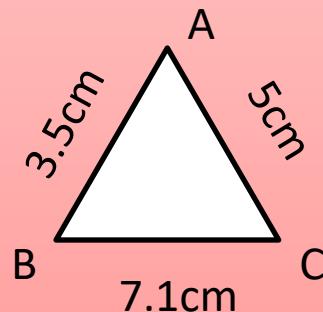

Prepared By:  
Mini Joy  
TGT (SS)  
AECS Kudankulam

There are basically four congruence conditions for triangles.

1. SSS congruence
2. SAS congruence
3. ASA congruence
4. RHS congruence

### 1] Side-Side-Side (SSS) congruence of triangles.

Consider two triangles ABC and PQR in which length of the three sides of each triangle is given.

$AB=PR= 3.5 \text{ cm}$

$BC=PQ= 7.1 \text{ cm}$

and  $AC=QR= 5\text{cm}$

This shows that the three sides of one triangle are equal to the corresponding three sides of the other triangle. So by SSS congruence rule the two triangles are congruent.

From the above three equality relations, it can be easily seen that  $A\leftrightarrow R$ ,  $B\leftrightarrow P$  and  $C\leftrightarrow Q$ .

So we have  $ABC \cong RPQ$ .

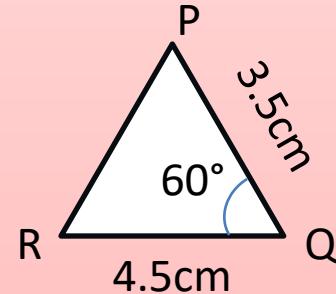

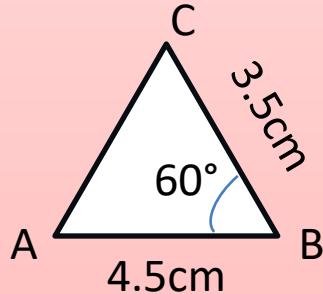

### SSS congruence criterion

If under a given correspondence, the three sides of one triangle are equal to three corresponding sides of the other triangle, then the triangles are congruent.

## 2] Side-Angle-Side (SAS) congruence

Let there be  $\Delta ABC$  and  $\Delta PQR$  such that  $AB=4.5\text{cm}$ ,  $BC= 3.5\text{cm}$  and  $\angle B=60^\circ$ .

Also  $QR=4.5\text{cm}$ ,  $PQ=3.5\text{cm}$  and  $\angle Q=60^\circ$ .

Make a trace copy of  $ABC$  and superimpose it on the triangle  $PQR$  so that  $AB \leftrightarrow RQ$  and  $BC \leftrightarrow PQ$ ,  $\angle B \leftrightarrow \angle Q$ . Thus, we find that two triangles cover each other exactly.

Hence,  $\Delta ABC \cong \Delta RQP$ .

We can also verify the congruence by measuring the sides  $AC$  and  $PR$  and also another pair of angles say  $\angle A$  and  $\angle R$ .

We find  $AC=4.5\text{cm}$ ,  $PR=4.5\text{cm}$ ,  $\angle A = 50^\circ$  and  $\angle R = 50^\circ$ .

We observe that  $AC=PR$ ,  $\angle A = \angle R$  and  $AB=RQ$ .  
Therefore,  $\Delta ABC \cong \Delta RQP$ .

### SAS congruence criterion

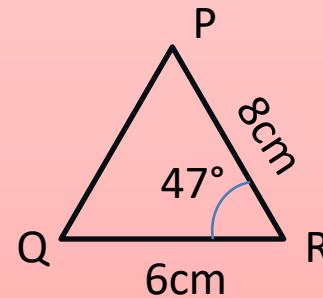

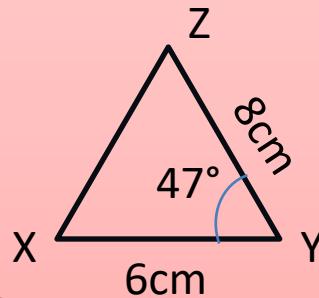

If under a correspondence, two sides and the angle included between them of a triangle are equal to two corresponding sides and the angle included between them of another triangle, then the triangles are congruent.

Eg 1: Given below the measures of some parts of two triangles. Examine whether the two triangles are congruent or not using SAS congruence criterion.

In  $\triangle XYZ$ ;  $XY=6\text{cm}$ ,  $YZ=8\text{cm}$ ,  $\angle Y= 47^\circ$ .

In  $\triangle QRP$ ;  $QR=6\text{cm}$ ,  $PR=8\text{cm}$ ,  $\angle R=47^\circ$ .

Soln: Let us make a rough sketch of the triangles before examining their congruence.

Clearly, here  $XY=QR=6\text{cm}$ .

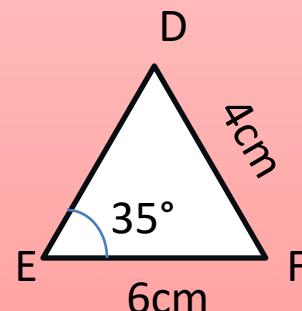

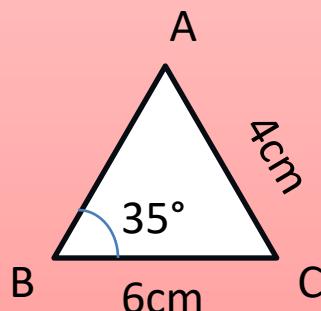

$ZY=PR=8\text{cm}$  and  $\angle Y=\angle R= 47^\circ$  (included angles).

Thus by SAS congruence criteria,  $\triangle XYZ \cong \triangle QRP$

Eg 2: Given  $\triangle ABC$  in which  $BC=6\text{cm}$ ,  $AC=4\text{cm}$  and  $\angle B=35^\circ$ .  $\triangle DEF$  in which  $DF=4\text{cm}$ ,  $EF=6\text{cm}$  and  $\angle E=35^\circ$ . Examine whether the two triangles are congruent or not.

Soln: Here  $BC= EF$ ,  $AC=DF$  and  $\angle B= \angle E$ . But  $\angle B$  is not the included angle between the sides  $AC$  and  $BC$ .

Similarly,  $\angle E$  is not the included angle between the sides  $EF$  and  $DF$ . So  $\triangle ABC$  and  $\triangle DEF$  are not congruent by SAS criterion.
