# Median of Group Data

## Median

The median is the middle value of a distribution *i.e.*, median of a distribution is the value of the observation which divides it into two equal parts.

- **Median of ungrouped data:**

(i) Arrange the data in ascending order.

(ii) If  $n$  (number of observations) is odd, then median =  $\left(\frac{n+1}{2}\right)^{\text{th}}$  observation.

(iii) If  $n$  (number of observations) is even, then median =  $\frac{1}{2} \left[ \left(\frac{n}{2}\right)^{\text{th}} \text{ observation} + \left(\frac{n}{2} + 1\right)^{\text{th}} \text{ observation} \right]$

(iii) If  $n$  (number of observations) is even, then median =  $\frac{1}{2} \left[ \left(\frac{n}{2}\right)^{\text{th}} \text{ observation} + \left(\frac{n}{2} + 1\right)^{\text{th}} \text{ observation} \right]$

- **Median of grouped data:** Median of a grouped data or continuous frequency distribution is found by using the formula:

$$\text{Median} = l + \left( \frac{\frac{n}{2} - cf}{f} \right) \times h$$

The distribution below given the marks of 30 students of a class in mathematics. Find the median marks of the students

Marks	40-45	45-50	50-55	55-60	60-65	65-70	70-75
No of Student	2	3	8	6	6	3	2

**Solution.**

Marks	Number of students ( $f_i$ )	Cumulative frequency ( $cf$ )
40–45	2	2
45–50	3	5
50–55	8	13
55–60	6	19 → median class
60–65	6	25
65–70	3	28
70–75	2	30

65–70	3	28
70–75	2	30
<b>Total</b>	$\Sigma f_i = 30$	

$$\Sigma f_i = n = 30, \frac{n}{2} = 15$$

Since  $cf$  just greater than  $\frac{n}{2} = 15$  is 19.

∴ The corresponding class is 55–60 which is the median class.

$$n = 30, \frac{n}{2} = 15, cf = 13, f = 6, h = 5$$

**In a unit test, the marks obtained by 100 students (out of 50) are given below**

<b>Marks Obtain</b>	<b>20</b>	<b>29</b>	<b>28</b>	<b>33</b>	<b>42</b>	<b>38</b>	<b>43</b>	<b>25</b>
<b>No of Student</b>	<b>6</b>	<b>28</b>	<b>24</b>	<b>15</b>	<b>2</b>	<b>4</b>	<b>1</b>	<b>20</b>

**Solution.** Arrange the variates (marks obtained) in ascending order and construct the cumulative frequency table as under:

Marks obtained	20	25	28	29	33	38	42	43
No. of students	6	20	24	28	15	4	2	1
Cumulative frequency	6	26	50	78	93	97	99	100

Total no. of observations =  $n = 100$ , which is even.

Total no. of observations =  $n = 100$ , which is even.

$$\text{So, the median} = \frac{\frac{n}{2}\text{th observation} + \left(\frac{n}{2} + 1\right)\text{th observation}}{2}$$

$$= \frac{50\text{th observation} + 51\text{th observation}}{2} = \frac{28 + 29}{2}$$

If the median of the distribution given below is 28.5 find the value of  $x$  and  $y$

Class Interval	0-10	10-20	20-30	30-40	40-50	50-60	total
Frequency	5	$x$	20	15	$y$	5	60

**Solution.** Here, median = 28.5,  $n = 60$

<i>Class interval</i>	<i>Frequency (<math>f_i</math>)</i>	<i>Cumulative frequency (cf)</i>
0-10	5	5
10-20	$x$	$5 + x$
20-30	20	$25 + x$
30-40	15	$40 + x$
30-40	15	$40 + x$
40-50	$y$	$40 + x + y$
50-60	5	$45 + x + y$
<b>Total</b>	$\Sigma f_i = 60$	

Since the median is 28.5, the median class is 20-30

•

$$\begin{aligned} \therefore \text{Median} &= l + \left( \frac{\frac{n}{2} - cf}{f} \right) \times h \Rightarrow 28.5 = 20 + \left( \frac{30 - (5 + x)}{20} \right) \times 10 \\ \therefore \text{Median} &= l + \left( \frac{\dots}{f} \right) \times \dots \quad \left( \dots \right) \quad 20 \\ \Rightarrow 28.5 &= 20 + \frac{25 - x}{20} \times 10 \Rightarrow 28.5 = 20 + \frac{25 - x}{2} \Rightarrow \end{aligned}$$

**THANK YOU**
